Norjohn Contracting
and Paving Limited

Cold Recycled Mix

Norjohn Contracting and Paving Limited has the ability to use 100% RAP (recycled asphalt pavement) in the construction of roads, lowering both the impact on the environment and the cost of materials.

CRM is placed, using a specialized mixing paver that blends the processed RAP with asphalt emulsion. This paver is equipped with computerized slope and grade controls and extrudes the mix through a conventional screed that initiates the compaction process. A complement of rollers finalizes compaction and the new base is ready for a wearing surface.

The process is an excellent and inexpensive way to add structural strength to an existing road and has been used to successfully convert low volume gravel roads into pavements that can support higher traffic counts.

The **REUSE** of aggregates and viable asphalt cement, reduces energy consumption, and in turn **REDUCES** the emission of green house gases, making the cold **RECYCLED** mix process an environmentally responsible practice.

Asphalt Removal

Process & Stockpile

Haul & Place

100% Cold Recycled Mix

The recycled asphalt pavement used in the CRM process can be drawn from various sources. Millings from large projects or excavations from small jobs can be processed for Cold Recycled Mixes.

To ensure your project is a success, Norjohn Contracting and Paving Limited, offers more than just the placement of CRM. Our services include; sourcing of recycled material, crushing and stockpiling, engineered mix designs and the application of a waterproof wearing surface.

COLD RECYCLED MIX

- Engineered Design
- Cost Effective
- Self-Healing
- Flexible
- Mitigates Cracking
