

Surface Treatment

**Norjohn Contracting
and Paving Limited**

Asphalt Emulsion Distributor

Chip Spreader and Pneumatic Roller

Norjohn Contracting and Paving Limited has been at the forefront of the surface treatment business since 1973.

The term "surface treatment" is fairly generic and can encompass many different types of processes or materials.

In Ontario, the most common methods of surface treatment, incorporate a layer of asphalt emulsion that is sprayed onto a prepared base, followed by an application of aggregate that is then set in place using rollers. This process can be repeated for double or triple applications.

Double surface treatment is a cost effective way to convert gravel roads to durable long lasting riding surfaces.

Creative advancements in distribution equipment, aggregate processing, and asphalt emulsion technology have taken an industry that was once considered an art-form into a precise and efficient science.

Quality surface treatment applications still require experienced personnel that understand how materials will react with each other, under various traffic and weather conditions.

Norjohn Contracting and Paving Limited starts with high quality material, uses state-of-the-art equipment and is meticulous in workmanship, all to ensure customer satisfaction.
