

# Walker Environmental Group

## The ways we move

Walker Environmental Group provides a wide range of transportation, recycling and disposal services to industrial, commercial and institutional customers across southern Ontario. Our shop is responsible for maintaining the many pieces of equipment.

### Walking Floor

- Walking floor trailers are used to transport a variety of bulk materials such as waste, compost and recyclables.
- A mechanical system on the floor of the trailer unloads waste by “walking” it out.
- Walker Environmental Group uses 53-foot aluminum walking floor trailers.
- These lighter trailers allow more material to be transported. That means more volume is moved with less trips using less fuel and producing fewer greenhouse gases.

Dump trailer delivering at biosolids facility

### Dump Trailers

- Dump trailers transport materials that are denser in volume and must be tipped into a specific location.
- They transport materials such as soils, source separated organics and biosolids.
- Our fleet runs 36-foot aluminum dump trailers.

### Roll-Off and Lugger Trucks

- These vehicles drop off and pick up containers from customer locations.
- The container is transported empty to the customer and left at their site to be filled.
- The truck picks up the filled container for transport to a waste management facility for recycling, processing or disposal.
- Roll-off and luggers trucks primarily service industrial and commercial customers.
- Roll-off bins are used by customers where volume is needed (i.e. construction and demolition waste), and lugger bins are used for more industrial applications (foundry sands and wastes).

#### How do you tell them apart?

Roll-Off trucks pull the box onto rails with a cable, where lugger trucks lift the box onto the bed of the truck.
